                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Conservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   oligo-dT primer containing a Not I site. Double stranded cDNA was size selected according to mRNA size fraction, ligated with ECOR I adaptor, digested with Not I, and then cloned directionally into pYX-Asc vector. The library tag sequence located between the Not I site and the polyA tail, is CAGCANGAC. This library was created for the University of Iowa Mouse Brain Molecular Anatomy Project (BMAP): 'Gene Discovery in the Developing Mouse Nervous System', supported by National Instututes of Mental Health (NIMH), Hemin Chir, Ph.D., program coordinator."

Size-selected by column fractionation; average insert size 1.08 kb. Library was amplified once on solid support and plasmid DNA from library was prepared. The library DNA was normalized by method #4 from Bonaldo, Lennon, and Soares 1996 Genome Research 6:791-806; 0.5 microgram single-stranded library plasmid DNA was mixed with 5 micrograms PCR product representing library inserts and hybridized to an Ecot of 20. Single-stranded (unhybridized) plasmids were isolated by hydroxyapatite chromatography and used to make this

Size-selected by column fractionation; average insert size 1.08 kb. Library was amplified once on solid support and plasmid DNA from library was prepared. The library DNA was normalized by method #4 from Bonaldo, Lennon, and Soares 1996 Genome Research 6:791-806; 0.5 microgram single-stranded library plasmid DNA was mixed with 5 micrograms PCR product representing library inserts and hybridized to an Ecot of 20. Single-stranded (unhybridized) plasmids were isolated by hydroxyapatite chromatography and used to make this
                                                                                                                                                                                                                                                                                                                    Ø
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /clone_lib="Melton Normalized Human

cc host cells, transgenic animals, fusion proteins, antigenic peptides con and antibodies. Also claimed are: a method for detecting the peptides crowdulating the activity of a 52906, 33408 or 12189 nucleic acid; a method for compound that binds the polypeptide; a method for identifying a compound which modulates the activity of the polypeptide; a method cor iterating or preventing an ion flux-related disorder using an compound which modulates the activity or expression of a 52906 or compound which modulates the activity or expression of a 52906 or compound which modulates the activity or expression of a 52906 or compound which modulates the activity or expression of a 52906 or compound which modulates the activity or expression of a 52906 or compound which modulates the activity or expression of a 52906 or compound which modulates the activity or expression of a 52906 or compound which modulates the activity or expression of a 52906 or controlled controlled polypeptide, antibody, antisense molecule, antibody antisense molecule, correctly correctly behalf modulates the activity or expression of a 52906 or controlled disorders, such as neurological disorders and central correctly correctly of a neurological disorders and central correctly correctly of disorders and neurodegenerative correctly disorders such as such

The for identifying expressed genes. [I] is useful in gene therapy techniques to restore normal activity of [II] or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical company of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating company of the polypeptide and polynucleotide sequences have applications in a diagnostics, forensics, gene mapping, identification of mutations can dispositics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and composition coding sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO as the print of the p

The invention relates to isolated NOVX (NOVX1-11) polypeptides and the polynucleotides that encode them. NOVX polypeptides, polynucleotides and anti-NOVX antibodies are useful for treating or preventing a pathology associated with NOVX polypeptide in humans and for treating a syndrome associated with human disease e.g. disorders characterised by altered cell motility, proliferation and migration e.g. cancer, angiogenesis and wound healing (NOV1-3), neurological disorders, e.g. episodic ataxia, autosomal dominant myokymia, stroke, Parxinson's disease, Alzheimer's disease, non-insulin dependent diabetes mellitus,

and seizure

(NOV4),

enamel

Novel polypeptides and nucleic acids homologous to members of collagen, potassium channel, tuftelin family of proteins for diagnosing, treating cancer, atherosclerosis, neurological, skin and enamel defect disorders

```
channel proteins and polynucleotides encoding such proteins. Sequences of the invention are useful in therapeutic, diagnostic and pharmacogenomic applications. They are useful for the identification of protein coding sequences, for mapping a unique gene to a particular chromosome, as additional DNA markers for restriction fragment length polymorphism (RPLP) analysis and in forensic biology, for screening libraries, isolating clones, preparing templates for cloning and sequencing, as hybridisation probes, in microarrays or other assay formats, to screen collections of genetic material from patients who have a particular disease and also as a diagnostic or prognostic assay. NHPs are useful for the detection of mutant human proteins or inappropriately expressed for the detection of mutant human proteins or inappropriately expressed.
                              for the detection of mutant human proteins or inappropriately expressed proteins for the diagnosis of disease, for the generation of antibodies, for screening for drugs effective in the treatment of symptomatic or phenotypic manifestations of perturbing the normal function of the protein in the body, for identification of other cellular gene products related to the protein and as reagents in assays for screening for compounds that can be used as pharmaceutical agents in the therapeutic treatment of mental, biological or medical disorders and diseases. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel human ion channel polynucleotide encoding protein sharing structural similarity with mammalian ion channel proteins, e.g. potassium channels useful in therapeutic, diagnostic and pharmacogenomic applications -

                                                                                                                                                                                  hyperactivity disorder, depression, anxiety, stroke, migraine, ischaemia or neurodegenerative disease (e.g. macular degeneration, Alzheimer's disease, glaucoma, or Parkinson's disease). The compounds that modulate ion channels can be used for treating of cardiovascular diseases (e.g. congestive heart failure, arrhythmia, high blood pressure or restenosis), metabolic diseases and disorders (e.g. diabetes or obesity), hormonal disorders (e.g. polycystic ovarian syndrome or alopecia) and proliferation diseases and cancers. The ion channels are also useful as targets for discovering ligands or drugs to treat many diverse disorders and defects. The ion-x sequences and their modulators may also be used in diagnostic assays for such diseases or conditions. Ton-x nucleic acids are used in gene therapy. The present sequence is a DNA encoding human ion channel designated as ion-166.
                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to ion channel polypeptides designated as ion-x (where x is 157-175) and their corresponding nucleic acids. The ion-x sequences and their modulators are useful for the treatment of human diseases and conditions such as neurological or psychiatric disorders. These compounds are useful for treating schizophrenia, attention deficit these compounds are useful for treating schizophrenia, attention deficit these compounds are useful for treating schizophrenia, attention deficit

                                                                                                                                                                                                                                                                           The DNA encodes a mouse Kvl.7, which is a Shaker-related voltigated potassium channel. It may be used in drug screening for identification of therapeutics which modulate the channel and therefore, modulate insulin secretion. Selective antagonists
                                                                                                                                                                                                                                                                                                                                                         New voltage-gated potassium channel gene - used to identify material(s) which can increase insulin release e.g. for treating non-insulin dependent diabetes mellitus.
                                                                                                                                                                                                                                                                                                                                                                                                                                         Chandy G,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ş
This sequence represents a novel method for identifying inhibitors or activators (A) of a eukaryotic potassium channel (KC) by applying a test compound to a mutant Saccharomyces cerevisiae cell in which: (1) the three endogenous KC (TRK1, TRK2 and TOK1) are not expressed; but (ii) a eukaryotic KC is expressed heterologously, where the effect of the compound on the eukaryotic KC is then determined. The method is used to identify inhibitors or activators (A) of a eukaryotic potassium channel. (A) are potentially useful as pharmaceuticals. The method is easily automated for parallel processing of many samples, using either different concentrations of test compounds and/or different levels of heterologous gene expression. It allows identification of compounds that inhibit human KC selectively. This sequence represents the human KV1.5 encoding DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1393

Diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver tumor in a painvolves detecting the level of expression of two or more patient, genes 'n

298pp; English.

cytostatic activity. The method is useful for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma and metastatic liver carcinoma in a patient. The method is useful for identifying expression profiles which serve as useful diagnostic markers as well as markers that can be used to monitor disease states, disease progression, drug toxicity, drug efficacy and drug metabolism. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO specification, but was obtained in electronic format directly from WIPO expression of two or more genes represented in $\mathtt{ABN93503}\text{-}\mathtt{ABN97455}$ tissue sample. The method of the invention has hepatotropic, and The invention relates to a novel method for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver tumour in a patient, and differentiating metastatic liver cancer from hepatocellular carcinoma in a patient, involving detecting the level of ftp.wipo.int/pub/published_pct_sequences. in a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a method (M1) for screening for an CC anti-neoplastic agent. The method involves exposing cells to a chemical CC agent to be tested for anti-neoplastic activity, determining a change in CC expression of at least one gene (I) of a signature gene set, where (I) CC comprises a sequence (S) selected from 8447 sequences (given in ABL61664 CC to ABL70110), or is at least 95% identical to (S), where a change in CC expression is indicative of anti-neoplastic activity. (I) has cytostatic CC activity and can be used in gene therapy. M1 can be used for screening CC an anti-neoplastic agent, and can be used for producing a product which CC is the data collected with respect to the anti-neoplastic agent as a CC result of M1, and the data is sufficient to convey the chemical CC treatment of cancer such as colon, breast, stomach, lung, thyroid, CC cesophageal, ovarian, kidney, prostate or pancreatic cancer, cadenocarcinoma, carcinoma, clear cell cancer, infiltrating ductal cancer, cinfiltrating lobular cancer, squamous cell carcinoma, neuroendocrine CC carcinoma, papillary carcinoma and wilm's tumour.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a method for examining ischaemic conditions, comprising measuring the expression levels of particular genes (I) in a test sample or determining the expression profile of a gene group in the sample comprising genes selected from (I). The method is useful for examining the ischaemic condition (e.g. compressive ischaemia or vasospastic ischaemia) by measuring expression levels of particular genes (AB199202 to AB199912, encoding the protein sequences in ABB57020 to AB57374) or by determining the expression profile of a gene group comprising these genes. The expression levels or expression profiles produced by these genes are captes as an indicator when screening for ischaemic condition improving drugs or therapeutics for ischaemic diseases. AB19913 and AB19914 represent PCR primers for a mouse ischaemic condition related sequence, which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Best Loc

Sequences AAS29511-AAS29736 represent cDNA molecules, which encode the endocrine polypeptides of the invention. Endocrine polypeptides and their associated polynucleotides of the invention are useful in the diagnosis, treatment and prevention of various types of disorders in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. A pathological condition can be determined by determining the presence or absence of a mutation in an endocrine polynucleotide. The treatable disorders include autoimmune diseases such as rheumatoid arthritis, hyperproliferative disorders such as neoplasms of the breast or liver, cardiovascular disorders such as cardiac arrest, cerebrovascular disorders such as cardiac arrest disorders such as cardiac arrest disorders such as cardiac arrest disorders such as cardiac arrest disorders such as cardiac arrest disorders such as cardiac arrest disorders such as cardiac arrest disorders such as cardiac arrest disorders such as cardiac arrest disorders such as cardiac arrest disorders such as cardiac arrest disorders such as cardiac arrest disorders such as cardiac arrest disorders such as cardiac arrest disorders arrest disorders arrest disorders arrest disorders arrest disorders arrest dis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ocular disorders such as corneal infection, endocrine disorders such as premature labour and infertility, gastrointestinal disorders such as Crohn's disease, renal disorders such as glomerulonephritis and respiratory disorders such as asthma. The polypeptides can also be used to aid wound healing, to prevent skin aging due to sunburn, to maintain organs before transplantation, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities.

(I) and polypeptides (III) encoded by (I), are used to treat a medical conditions and in diagnosis of a pathological condition. Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. Alzheimer's disease and amylotrophic lateral sclerosis, infections caused by bacteria, viruses e.g. Acquired immunodeficiency virus (AIDS) and fungi, coular disorders e.g. corneal infection, gastrointestinal disorders e.g. dysphagia, adenocarcinomas and irritable bowel syndrome, reproductive system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          disorders e.g. testicular feminisation, endocrine disorders e.g. diabete and pituitary dwarfism, cancers and disorders at the cellular level e.g. leukaemia, disorders involving neovascularisation e.g. malignancies, respiratory disorders e.g. nonallergic rhinitis, renal disorders e.g. acute kidney failure and blood related disorders e.g. myocardial infarction. The polypeptides can also be used to aid wound healing and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides human cDNAs, proteins and related gen DNAs. These can be used in the treatment of neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal and proliferative disorders and inflammation. The present sequis a cDNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Isolated nucleic acid molecule encoding an inflammation-associated polypeptide is used in preventing, treating or ameliorating a medical condition -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WPI; 200

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to the isolation of novel human uterine motility-association polypeptides (AAU18094-AAU18152), and cDNA and genomic sequences encoding for these polypeptides. The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of diseases associated with uterine motility such as pregnancy and labour, and menstrual disorders. The polynucleotide sequences of the invention are also useful in gene therapy. AAS28936-AAS28994 represent cDNA sequences encoding for novel human uterine motility-association polypeptides. Note: The sequence data for this patent did not form part of the prespectification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Isolated polypeptide and nucleic acid molecules for treating, preventing and/or prognosing disorders related to uterine motility e.g. disorders associated with pregnancy and the menstrual cycle -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequences AAS29511-AAS29736 represent cDNA molecules, which encode the endocrine polypeptides of the invention. Endocrine polypeptides and their associated polynucleotides of the invention are useful in the diagnosis, treatment and prevention of various types of disorders in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. A pathological condition can be determined by determining the presence or absence of a mutation in an endocrine polynucleotide. The treatable
                                                                                                                                                                                                                                                                                                                                                                          respiratory disorders such as asthma. The polypeptides can also be used to aid wound healing, to prevent skin aging due to sunburn, to maintain organs before transplantation, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to

 purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
 was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwb42 (gil4732114|gb|AFT29072.1), a copy-number inducible derivative of plasmid RI. The vector was ligated with adaptors complementary to the insert adaptors and purified the shared adaptors to the insert adaptors.
 /note="Vector: PWD42nv; Purified genomic DNA from M. musculus C57BL/6J (male) was obtained from the Jackson
 (http://www.jax.org/resources/documents/dnares/).

Human cDNA encoding NOV4 protein.

Human; NOV4; ss; cytostatic; nootropic; neuroprotective; vulnerary; cerebroprotective; antiparkinsonian; hypotensive; antiasthmatic; antiparkatic; antinflammatory; immunosuppressive; antiatherosclerotic; dermatological; cancer; neurological disorder; Parkinson's disease; diabetes mellitus; asthma; enamel defect; immune disorder; autoimmune disease; respiratory disorder; bone disorder; musculoskeletal disorders; leukaemia; lymphoma; cell growth regulation disorder; lesional psoriatic skin;

```
Alignment Pred. No.:
 CC the polynucleotides that encode them. NOVX polypeptides, polynucleotides cand anti-NoVX antibodies are useful for treating or preventing a CC pathology associated with NOVX polypeptide in humans and for treating a CC syndrome associated with human disease e.g. disorders characterised by CC altered cell motility, proliferation and migration e.g. cancer, CC angiogenesis and wound healing (NOV4), neurological disorders, e.g. CC disease, Alzheimer's disease, non-insulin dependent diabetes mellitus, CC asthma, hypertension and seizure (NOV4), enamel defects, such as CC including hyperlasia and hypomineralisation (NOV5-7), paraneoplastic concurological disorders, e.g. paraneoplastic including hyperlasia and hypomineralisation (NOV5-7), paraneoplastic concurring during testicular cancer, diabetes, reproductive CC including hypoplasia and endocrine disorders, gastrointestinal disorders, immune disorders and antolimune disorders, gastrointestinal disorders, CC immune disorders and antolimune disorders, pastrointestinal disorders, CC immune disorders and antolimune disorders, leukaemia/lymphoma and tissue/cell crowth regulation disorders (NOV8), lesional psoriatic skin (NOV9-10) and atherosclerosis, abdominal aortic aneurysm and neurological disorders (NOV1). NOVX polypeptide is also useful for identifying an agent that that the bodies and cell expressing NOVX polypeptide is useful for claentifying an agent that CC identifying a therapeutic agent for use in treatment of a NOVX related CC pathology. The antibodies and a polypeptide having 95% sequence identity to NOVX polypeptide are useful for treating a pathological state in a CC mammal. The present sequence encodes NOV4, a possible voltage gated CC potassium channel.

CC channel proteins and polynucleotides encoding such proteins. Sequences of the invention are useful in therapeutic, diagnostic and pharmacogenomic CC applications. They are useful for the identification of protein coding Sequences, for mapping a unique gene to a particular chromosome, as CC additional DNA markers for restriction fragment length polymorphism CC (RFLP) analysis and in forensic biology, for screening libraries, CC isolating clones, preparing templates for cloning and sequencing, as CC hybridisation probes, in microarrays or other assay formats, to screen CC collections of genetic material from patients who have a particular CC disease and also as a diagnostic or prognostic assay. NMPs are useful CC for the detection of mutant human proteins or inappropriately expressed CC proteins for the diagnosis of disease, for the generation of antibodies, CC for screening for drugs effective in the treatment of symptomatic or CC phenotypic manifestations of perturbing the normal function of the CC protein in the body, for identification of other cellular gene products CC related to the protein and as reagents in assays for screening for CC compounds that can be used as pharmaceutical agents in the therapeutic CC treatment of mental, biological or medical disorders and diseases. The CC protein in the collaboration of the collaboration in assays for screening for CC compounds that can be used as pharmaceutical agents in the therapeutic CC treatment of mental, biological or medical disorders and diseases.  The invention relates to isolated polynucleotide (I) and CD polypeptide (II) sequences. (I) is useful as hybridisation probes, CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC and gene mapping, and in recombinant production of (II). The CC construction of the construction o
 New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity

 US-09-804-014A-8 (1-559) x ABI99654 (1-3147)
 The present invention describes a method for examining ischaemic CC conditions, comprising measuring the expression levels of particular CC genes (I) in a test sample or determining the expression profile of a CC gene group in the sample comprising genes selected from (I). The method CC is useful for examining the ischaemic condition (e.g. compressive CC ischaemia, occlusive ischaemia or vasospastic ischaemia) by measuring CC expression levels of particular genes (ABI99202 to ABI99912, encoding CC the protein sequences in ABB57020 to ABB57374) or by determining the CC expression profile of a gene group comprising these genes. The CC expression levels or expression profiles produced by these genes are CC used as an indicator when screening for ischaemic condition improving CC drugs or therapeutics for ischaemic diseases. ABI99913 and ABI99914 CC represent PCR primers for a mouse ischaemic condition related sequence, CC which are used in the exemplification of the present invention.

 cytostatic activity. The method is useful for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma and metastatic liver carcinoma in a patient. The method is useful for identifying expression profiles which serve as useful diagnostic markers as well as markers that can be used to monitor disease states, disease progression, Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
 hepatocellular carcinoma in a patient, involving detecting the level of expression of two or more genes represented in ABN93503-ABN97455 in a tissue sample. The method of the invention has hepatotropic, and
 The invention relates to a novel method for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver tumour in a patient, and differentiating metastatic liver cancer from
 biagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver tumor in a painvolves detecting the level of expression of two or more liver tissue sample

 Score:
 expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producting a product which is the data collected with respect to the anti-neoplastic agent as a result of MI, and the data is sufficient to convey the chemical structure and/or properties of the agent. MI can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney, prostate or pancreatic cancer, affiltrating lobular cancer, squamous cell cancer, infiltrating ductal cancer, squamous cell carcinoma, neuroendocrine

 This sequence represents a novel method for identifying inhibitors or activators (A) of a eukaryotic potassium channel (KC) by applying a test compound to a mutant Saccharomyces cerevisiae cell in which: (1) the three endogenous KC (TRK1, TRK2 and TOK1) are not expressed; but (ii) a eukaryotic KC is expressed heterologously, where the effect of the compound on the eukaryotic KC is then determined. The method is used to identify inhibitors or activators (A) of a eukaryotic potassium channel. (A) are potentially useful as pharmaceuticals. The method is easily automated for parallel processing of many samples, using either different concentrations of test compounds and/or different levels of heterologous gene expression. It allows identification of compounds that inhibit human KC selectively. This sequence represents the human KV1.5 encoding DNA described in the method of the invention.

 capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).
 The
 The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published_pct_sequences.

 The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, ADDS, eppilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.
 Nucleic acid comprising fragment of chemically modified gene, useful for diagnosis and treatment of diseases associated with abnormal cytosine methylation \,

 Alignment Scores:
Pred. No.:
Score:
 The invention relates to ion channel polypeptides designated as ion-x (where x is 157-175) and their corresponding nucleic acids. The ion-x sequences and their modulators are useful for the treatment of human diseases and conditions such as neurological or psychiatric disorders. These compounds are useful for treating schizophrenia, attention deficit hyperactivity disorder, depression, anxiety, stroke, migraine, ischaemia or neurodegenerative disease (e.g. macular degeneration, Alzheimer's disease, glaucoma, or Parkinson's disease). The compounds that modulate ion channels can be used for treating of cardiovascular diseases (e.g. congestive heart failure, arrhythmia, high blood pressure or restenosis), metabolic diseases and disorders (e.g. diabetes or obesity), hormonal disorders (e.g. polycystic ovarian syndrome or alopecia) and proliferation diseases and cancers. The ion channels are also useful as targets for discovering ligands or drugs to treat many diverse disorders and defects. The ion-x sequences and their modulators may also be used in diagnostic assays for such diseases or conditions. Ion-x nucleic acids are used in gene therapy. The present sequence is a DNA encoding human ion channel designated as ion-166.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 /note-*organ: pooled lung and spleen; Vector: pCMV-SPORT6; Site_1: NotI; Site_2: EcoRV (destroyed); RNA source anonymous pool of 24 week female lung, 16 week female spleen, and 20-22 week male spleens. Library is oligo-dr primed and directionally cloned (EcoRV site is destroyed upon cloning). Average insert size 1.4 kb, insert size range 1-3 kb. Library is normalized and enriched for full-length clones and was constructed by C. Gruber (Invitrogen). Research Genetics tracking code 026. Note: this is a NIH MGC Library.*

 adaptored vector DNA, and transformed into chemically-competent E. coli XIIO-Gold (Stratagene) cells and selected for ampicillin resistance."

163 c 161 g 131 t
 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pMD42 (gil4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to
 Laboratory Mouse DNA Resource (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to

 /note="Organ: Pancreas; Vector: pSPORT1; Site_1: Not 1; Site_2: Sal 1; Starting library constructed using SuperScript Plasmid Library kit (Life Technologies). cDNA made by oligo-dT priming. Size-selected by column fractionation; average insert size 1.08 kb. Library was amplified once on solid support and plasmid DNA from library was prepared. The library DNA was normalized by method #4 from Bonaldo, Lennon, and Soares 1996 Genome Research 6:791-806; 0.5 microgram single-stranded library plasmid DNA was mixed with 5 micrograms PCR product representing library inserts and hybridized to an Ecot of 20. Single-stranded (unhybridized) plasmids were isolated by budgates and single-stranded for the stranded to an exercise of the budgates and single-stranded control plasmids were isolated by budgates.

Miner,G., Miner,Z., Mitchell,T., Mohabbat,K., Morgan,M., Morris,S., Moser,M., Neal,D., Newtson,J., Newtson,N., Nguyen,A., Nguyen,N., Nguyen,N., Nguyen,N., Nguyen,N., Oraqunye,N., Ordedo,R., Pace,A., Payton,B., Peery,J., Perez,L., Pickens,R., Primus,E., Pu,L.L., Quiles,M., Ren,Y., Rlves,M., Rojubokan,I., Rollee,M., Ruiz,S., Savery,G., Scherer,S., Scott,G., Shen,H., Shocshtari,N., Sisson,I., Scherer,S., Savery,G., Scherer,S., Savetk,A., Tabor,P., Tamerisa,A., Tamerisa,K., Tang,H., Tansey,J., Taylor,C., Taylor,P., Tamerisa,A., Thomas,N., Thomas,S., Usmani,K., Vasquez,L., Vera,VY., Villalon,D., Vinson,R., Wang,O., Wang,S., Ward-Moore,S., Warren,R., Washington,C., Watlington,S., Wulliams,G., Williams,G., Williams,G., Worley,K., Wulliams,G., Welson,D., Vinson,S., Wulliams,G., Wulliams,G., Nelson,D., Vinson,S., Weinstock,G. and Gibbs,R.
 NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a 'working draft' sequence. It currently consists of 55 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
 Mohabbat, K., Morgan, M., Morris, S.,
 Submitted (24-JUL-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA 17030 Center: Genome Center Center: Baylor College of Medicine

SEQUENCING READ COVERACE:Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the annotation as Low Coverage.
 Incal mapping efforts.

Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences.

Genes and Region of sequence similarity are identified by BLAST (Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to the EST and cDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.
 only
 QUALITY OF INDIVIDUAL BASES: This sequence meets stringent quality standards - estimated error rate less than 1 per 10,000 bases. Reports of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found at URL: http://gc.bcm.tmc.edu:8088/quality.info/genbank.annotation.

 Direct Submission Submitted (15-MAR-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA On Jan 20, 1999 this sequence version replaced gi:4071009. INFORMATION: http://gc.bcm.tmc.edu:8088/home.html or email
 CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are only sequenced and submitted once, so the sequence for the remainder of the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the Features listing.
 Direct Submission
Submitted (29-DEC-1998) Human Genome Sequencing Center, Department
of Molecular and Human Genetics, Baylor College of Medicine, One
Baylor Plaza, Houston, TX 77030, USA
 STSs are identified using ePCR (Genome Res. 7:541-550) searches of a local database that includes entries from dbSTS, GDB, and

/dab_lost="DH108" (Life Technologies)"
//dab_lost="DH108" (Life Technologies)"
//note="Vector: pT773D-pac (Pharmacia) with a modified
polylinker; Site_1: Not I: Site_2: ECO RI; The UI-R-DKO
library is a subtracted library derived from a mixture of
five individually tagged normalized rat libraries:
brain-nRBP (20%), heart-nRHP (20%), kidney-nRKP (20%),
aorta-nRAP (20%), heart-nRHP (20%), Each original
library was constructed from a mixture of equal amounts of
RNA from seven different developmental time-points:
embryonic day 17, embryonic day 19, embryonic day 21,
adult day 1, adult day 12, adult day 75, and adult day
200. (Exception: the aorta pool does not contain embryonic
day 17RNA and the placenta pool contains only the three
embryonic stages). Each library was normalized
individually according to the procedure described by
Bonaloo, Lennon & Soares (Genome Research Genome 6:
791-806, 1996). For construction of the Eive individually
tagged normalized libraries was mixed in the proportions
specified above and electroporated into competent bacteria
for production of single-stranded circular DNA
representing the pool of libraries. Single-stranded
circular DNA representing these five normalized libraries
was then used as a tracer in a subtractive hybridization
with a driver (PCR amplified inserts from a plasmid DNA
template preparation) comprising: a set of about 1,000
arrayed clones from each of the five non-normalized
libraries of brain (CT08), heart (CS08), kidney (CU08),
aorta (CW08), and placenta (CX08). Hither esulting pool of
approximately 5,000 clones represented about 33.3% of the
final driver population. A set of about 2,000 arrayed
clones from each of the five normalized libraries of brain
from set of about 2,000 arrayed
clones from each of the five normalized libraries of brain
from set of about 2,000 arrayed
clones from each of the five normalized libraries of brain
from part from a set of about 2,000 arrayed
 The sequence contained an oligo-dT track that was present in the oligonucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the cDNA between the NotI site and the oligo-dT track served to identify it as a clone from the normalized rat placenta pool library cDNA Library Preparation: M.B. Soares Lab Clone distribution: clones will be available through elements were found in this cDNA sequence: 1-41,
 ö
 (CT0), heart (CS0), kidney (CU0), aorta (CW0), and placenta (CX0). The resulting pool of about 10,000 clones represented about 66.6% of the final driver population.

NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a "working draft' sequence. It currently consists of 55 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as arbitrary. Gaps between the contigs are represented as This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

 AC073711 208632 bp DNA linear HTG 18-JUL-2000
Mus musculus clone RP23-193A10, WORKING DRAFT SEQUENCE, 7 ordered
 Submitted (29-JUN-2000) Production Sequencing Facility, DOE Joint Genome Institute, 2800 Mitchell Drive, Walnut Creek, CA 94598, USA On Jul 18, 2000 this sequence version replaced gi:8810328.
 Craniata; Vertebrata; Euteleostomi;
Sciurognathi; Muridae; Murinae; Mus.
 Consensus quality: 204234 bases at least Q40
Consensus quality: 207322 bases at least Q30
Consensus quality: 207322 bases at least Q30
Consensus quality: 207805 bases at least Q30
Estimated insert size: 221930; agarcse-fp estimation
Estimated insert size: 208382; sum-of-contigs estimation
Quality coverage: 8.77 in Q20 bases; agarcse-fp estimation
Quality coverage: 9.34 in Q20 bases; sum-of-contigs estimation.
* NOTE: This is a "34 in Q20 bases; sum-of-contigs estimation.
* consists of 7 contigs. Gaps between the contigs
* are represented as runs of N. The order of the pieces
 1525 GTGGACTCTGAGGTGCTGAACTCCTCCCACCACTGGCCCCCTGCAGGAAACACATG 1584
GCTGAAGTGGACCGGGTGGACACCCATTTCACCAGCATCCCGGAGTCCTTTTGGTGGCCA 1284

 515
 516 PheSerHisValAspMetGlnProCysGlyProLeuGluGlyLysAlaAsnGlyGlyLeu 535 :::||||||||||||||
 is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.

This sequence will be replaced by the finished sequence as soon as it is available and

 NOTE: This is a 'working draft' sequence. It currently consists of 4 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

 Direct Submission

As submitted (23-FEB-2001) Sanger Centre, Hinxton, Cambridgeshire, CB10 15A, UK. E-mail enquiries: humquery@sanger.ac.uk clone requests: clonereques@sanger.ac.uk

no or before May 15, 2001 this sequence version replaced

g1:7283305, g1:12718091.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone mame. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quantity data (1-e., phred quality) = 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; WP:, WORMPEP; Information on the WORMPEP; database can be found at

http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 1, constructed by the Sanger Centre Chromosome 1 Mapping Group. Further information can be found at
 Assembly
 http://www.sanger.ac.uk/HGP/Chrl
RPI1-284NB is from the library RPCI-11.1 constructed by the group
of Pieter de Jong. For further details see
 IMPORTANT: This sequence is not the entire insert of clone RP11-284N8 It may be shorter because we sequence overlapping sections only once, except for a 100 base overlap. The true left end of clone RP11-284N8 is at 1 in this sequence. The true left end of clone RP1-244G5 is at 15544 in this sequence. The true right end of clone RP11-470L19 is at 76605 in this sequence. It coation/Qualifiers

Canady, Kr.G., Williams, C.B., Spencer, R.H., Aguilar, B.A.,
Ghanshani, S., Tempel, B.L. and Gutman, G.A.
A family of three mouse potassium channel genes with intronless
coding regions.

Coding regions
Science 247, 943-975 (1990)
[2] sites; for [1].
Authorin submission [1] kindly submitted by Gutman, G.A.,
05-DEC-1989
MKI, MKZ and MK3 represent three members of a family of mouse genes
encoding potassium channel proteins, related to the Drosophila
shaker locus. Each mouse protein is encoded by a single,
uninterrupted exon, although one (or more) introns may be present
in the 5' untranslated region (MKI, MKZ). MK3 closely resembles
the published rat cDNA sequence RCK3 (Stuhmer et al., EMBO J.

8:3235, 1989).
Location (MCI, MCI) and (MCI, MCI) and (MCI) and (

 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

as antisense nuclet acid molecules, recommonant expression vectors, host cells, transgenic animals, fusion proteins, antigenic peptides and antibodies. Also claimed are: a method for detecting the presence of a 52906, 33408 or 12189 poulcied a method for andulate that binds the polypeptide; a method for identifying a compound which modulates the activity of the polypeptide; a method of treating or preventing an ion flux-related disorder using an agent that modulates the activity or expression of a 52906 or 12189 polypeptide; mall molecule, antibody, antisense molecule, phosphopeptide, small molecule, antibody, antisense molecule, or thosyme, a triple helix molecule, or a 52906 or 12189 nucleic acid. The ion flux-related disorders include: potassium channel associated disorders, such as neurological disorders and central nervous system disorders such as neurological disorders and central nervous system disorders such as neurological disorders such as mention of siscase, gantinson's disease, gantinson's disease, senile disorders such as multiple sclerosis, progressive supranuclear palsy, epilepsy, Jacobe-treutzfeld disorders, neuropsychiatric disorders such as adepression, schizophrenia, mania, anxiety disorders such as a depression, schizophrenia, mania, anxiety disorders such as a retrainsoin and sleep disorders, neuropsychiatric disorders such as a retrainsoin and sleep disorders, neuropsychiatric disorders such as a retrainsoine or obesity; cardiac-related disorder, obsessive-compulsive disorder, migraine or obesity; cardiac-related disorder, mycordial cardiac and nucleic acids are all manial and sleep disorders, manial and sleep disorders, and sease disorders and thermation, tachycardia, congestive heart failure, mycordial are all and sorder and the polypeptides and nucleic acids are all as ouseful as and therefore the and propried and arrhythmia. The polypeptides and nucleic acids are also useful as deadly and arrhythmia and the polypeptide and nucleic acids are also useful as and arrhythmia and the polypep
 New potassium channel family member polypeptide and polynucleotide, useful for diagnosing, treating viral diseases, neurological, cardiac, cellular proliferative or differentiative, bone, immune, liver and
 contains a potassium channel tetramerisation domain, an ion transport protein domain and a core membrane region including 6 transmembrane domains. The invention provides human potassium channel 52906, 33408 and 12189 nucleic acids and proteins, as well as antisense nucleic acid molecules, recombinant expression vectors,
 controlling cellular proliferative and/or differentiative disorders e.g. haematopoletic neoplastic disorders, carcinoma and sarcoma; disorders associated with bone metabolism such as osteoporosis,
 The present sequence is that of a partial cDNA for human 12189 (see ABB76166), a novel potassium channel family member. 1218

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymersae chain reaction (PCR) primers, Oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (II) and (II) are useful in medical insorders involving aberrant protein expression or biological activity.

 The present invention relates to novel human proteins (NHPs), human ion channel proteins and polynucleotides encoding such proteins. Sequences of the invention are useful in therapeutic, diagnostic and pharmacogenomic applications. They are useful for the identification of protein coding sequences, for mapping a unique gene to a particular chromosome, as additional DNA markers for restriction fragment length polymorphism (RRLP) analysis and in forensic biology, for screening libraries, isolating clones, preparing templates for cloning and sequencing, as hybridisation probes, in microarrays or other assay formats, to screen collections of genetic material from patients who have a particular medical condition, to identify mutations associated with a particular disease and also as a diagnostic or prognostic assay. NHPs are useful for the detection of mutant human proteins or inappropriately expressed proteins for the diagnosis of disease, for the generation of antibodies,

DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oilgonucleotides and/or peptide-nucleic acid (PMA) oilgomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oilgomers, the degree of methylation is calculated. The method is used: (i) for diagnosis and/or prognosis of side effects of the central nervous, cardiovascular, gastrointestinal and respiratory of the central nervous, cardiovascular, gastrointestinal and respiratory express etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously.

ABO13410-ABO54121 represent genomic DNA sequences used to illustrate the method for determining the degree of cytosine methylation described in the invention.

 methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratto of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used (i) for diagnosis and/or prognosis of side effects of the reapentic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory continues etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation of cell or tissue types and for investigating cell differentiation. The method allows the method for determining the degree of cytosine methylation described in the disclosure of the invention.

The invention relates to a novel method for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver tumour in a patient, and differentiating metastatic liver cancer from hepatocellular carcinoma in a patient, involving detecting the level of expression of two or more genes represented in ABN3503-ABN97455 in a tissue sample. The method of the invention has hepatocropic, and cytostatic activity. The method is useful for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma and metastatic liver carcinoma in a patient. The method is useful for identifying expression profiles which serve as useful diagnostic markers as well as markers that can be used to monitor disease states, disease progression,
 drug toxicity, drug efficacy and drug metabolism.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

The present invention describes a method (MI) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) ceptically, or is at least of selected from 8447 sequences (given in AbL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of MI, and the data is sufficient to convey the chanical carrier of an ancer such as colon, breast, stomach, lung, thyroid, ceptibageal, ovarian, kidney, prostate or pancreatic cancer, adenocarcinoma, carcinoma, clear cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's tumour.

activators (A) of a cukaryotic potassium channel (KC) by applying a test compound to a mutant Saccharomyces cerevisiae cell in which: (i) the three endogenous KC (TRK1, TRK2 and TOK1) are not expressed; but (ii) a cukaryotic KC is expressed heterologously, where the effect of the compound on the cukaryotic KC is then determined. The method is used to identify inhibitors or activators (A) of a cukaryotic potassium channel. (A) are potentially useful as pharmaceuticals. The method is easily automated for parallel processing of many samples, using either different concentrations of test compounds amond/or different levels of heterologous gene expression. It allows identification of compounds that inhibit human KC selectively, This sequence represents the human KV1.5 encoding DNA
 Identifying inhibitors and activators of eukaryotic potassium channels, for use as pharmaceuticals, comprises using yeast cells that express heterologous, but no endogenous, potassium channels -
 This sequence represents a novel method for identifying inhibitors or

 genes (1) in a test sample comprising genes selected from (1). The method sene group in the sample comprising genes selected from (1). The method is useful for examining the ischaemia or condition (e.g. compressive ischaemia or vasospastic ischaemia) by measuring expression levels of particular genes (AB199202 to AB199912, encoding the protein sequences in ABB57020 to ABB57374) or by determining the expression profile of a gene group comprising these genes. The expression levels or expression profiles produced by these genes are used as an indicator when screening for ischaemic condition improving drugs or therapeutics for ischaemic diseases. AB199913 and AB199914 represent PCR primers for a mouse ischaemic condition related sequence, which are used in the exemplification of the present invention.
 Examining the ischemic condition (e.g. occlusive ischemia) by measuring expression levels of particular genes defined in the specification or by determining the expression profile of a gene group comprising these

This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic convert cytosine (C) but not methylated C, to uracil, then part of the genomic convert contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and-the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method classes of oligomers, the degree of methylation is calculated. The method classes of oligomers, the degree of methylation is calculated. The method is used: (1) for diagnosis and/or prognosis of side effects of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide cypes and for investigating cell differentiation. The method allows the method allo
